1 Summary

The multiphonon python package calculates a phonon density of states from inelastic neutron scattering (see, for example [1]) spectrum from a powder sample. The algorithm is a self-consistent, iterative procedure that finishes when the measured spectrum can be accounted for by the one-phonon scattering, multiphonon scattering, and multiple scattering from the deduced phonon density of states, under the incoherent approximation (Appendix of [2] and Section 6.5 “Calculation of Multiphonon Scattering” of [1]).
